In Reply.—Although industry and the Food and Drug Administration itself commonly use the words label and off-label when referring to the package insert, Dr. Moore is correct in stating that Federal Regulations define the label as wording appearing on a carton, bottle, syringe, or ampule.

Use of the Endotrrol Endotracheal Tube and a Light Wand for Blind Nasotracheal Intubation

To the Editor.—I read with interest the report by Iseki et al., who attached a string to the tip of a lighted wand (Trachlight; Laerdal Medical, Armonk, NY) and inserted this modified wand into an endotracheal tube to maneuver the tip of the tube during blind nasotracheal intubation. I suggest that an alternative method is to use the Trachlight and Endotrrol tube (Mallinckrodt, Athlone, Ireland). After the inner metal stylet has been removed from the Trachlight, the wand is inserted into the Endotrrol tube until the tip of the wand reaches the tip of the tube. The Endotrrol tube has a wire hook with which the curve of the tube can be controlled. Therefore, a similar effect can be obtained without modifying any product.

Ken Iseki, M.D.

In Reply.—We thank Dr. Asai for his interest in our report. It does appear that the use of the Endotrrol tube with the Trachlight accomplishes the same result as the modification we described. However, because our approach can be used with many different types of endotracheal tubes, it may be more generally applicable.
